AI and Digital Governance

As new forms of artificial intelligence, namely generative AI, continue to see widespread usage and integration across societies, it is necessary to address the promise of artificial intelligence for governance both globally and locally. How can we harness the power of these emerging technologies in order to improve public service delivery, broaden access to crucial information, fight misinformation and disinformation, and uplift communities?

The goal of this committee is to debate and discuss in a comprehensive manner how these emerging technologies may be applied in a beneficial way, while also recognizing and working to mitigate their known disadvantages. Technical integration within government has always been a challenge in and of itself, as bureaucracies and institutions struggle to integrate new ways of working while staying in compliance with existing regulations and specifications previously iterated by past legislation and directives.

The urgency of this topic is evident today as private industry begins to reap substantial benefits from progress in these fields, and governments begin to move their regulatory might towards defining this space and identifying future problems.
