Topic Summary:

In the expanding world of technology, the presence of artificial intelligence has become more and more prominent in modern society. Despite its growing influences and its increasingly accurate predictions, artificial intelligence is still often distrusted in many societies across the globe. Some view artificial intelligence with caution because it is a more novel technology. Others are wary of artificial intelligence because of the biases that it can sometimes present.

This committee aims to address the increasing concerns surrounding the ethical and equitable use of artificial intelligence among all communities throughout the world. How can we ensure that the underrepresented populations can share the benefits of artificial intelligence while also making sure that private corporations don't take advantage of these underrepresented populations like they have in the past? How can we also better incorporate artificial intelligence into the medical industry, where software can better help doctors?
